

RETAIL SALES PERFORMANCE & CUSTOMER ANALYTICS REPORT

Project Overview

This project analyzed retail sales transactions using SQL and Power BI to identify revenue trends, product performance, customer purchasing behavior, and geographic sales patterns.

Tools Used

- MySQL
- SQL (Joins, Aggregations, Subqueries, ROW_NUMBER, RANK, PARTITION BY)
- Power BI

Key Insights

1. Product Performance

Classic Cars generated the highest revenue contribution and significantly outperformed other product lines.

2. Revenue Trend

Sales increased initially before declining toward the end of the analysis period, indicating a potential slowdown in demand.

3. Customer Contribution

A small group of customers generated a disproportionately large share of total revenue.

4. Geographic Performance

The United States was the strongest-performing market by revenue.

5. Deal Size Distribution

Small and medium deals represented the majority of transactions, while large deals contributed a smaller share of order volume.

Recommendations

- Prioritize top-performing product lines.
- Implement retention programs for high-value customers.
- Investigate causes of declining sales trends.
- Expand successful strategies into high-performing markets.
- Increase average order value through upselling and bundling.

Conclusion

The analysis demonstrates how SQL and Power BI can transform raw sales data into actionable business insights that support data-driven decision-making.
